## Global Warming

[XML](#)

If some environmentalists are to be believed, we are on the verge of massive global climate change which will see a significant rise in sea levels, chaotic weather patterns, and catastrophic droughts all caused by small increase in global average temperature.

This site provides links to resources skeptical of those sort of doomsday scenarios. The articles linked to here are written by a wide variety of people, from scientists to laypeople, and their inclusion here should not be read as an endorsement of their positions.

Just as when dealing with things coming out of the environmentalist camp, you need to use your brain and decide for yourself to what extent global warming poses a threat to humanity.
